### Excellent Eye Diagram Pre-test and Jitter Analysis

#### Eye Diagram

Based on the excellent bandwidth and sample rate, DS70000 series oscilloscope provides the real-time eye plot and measurement with the clock recovery function, which can be applied to protocol conformance analysis.

After the DS70000-JITTA option has been purchased and activated, DS70000 series supports the eye measurement for all the analog channels, and also provides measurement for several parameters of the eye diagram: **eye height, eye width, eye amplitude, crossing percentage, and Q Factor**. It also supports various clock recovery methods, eye cursor measurement, and eye template measurement to meet the demands of customers for different application scenarios.

#### Jitter

DS70000 series oscilloscope provides flexible and convenient jitter measurement and analysis. After purchasing and activating the DS70000-JITTA option, you can accurately and quickly make deterministic jitter measurements for serial clock signals or parallel bus signals.

Support various clock recovery methods, including:

- **Constant:** Fully automatic, semi automatic, and manual
- **First-order PLL**
- **Second-order PLL**
- **Explicit**

To help engineers easily and conveniently resolve the jitter components within their signals, jitter measurements can be analyzed in multiple formats including the trend graph, spectrum graph, and histogram. The jitter analysis function enables **measurement and statistical analysis of uninterrupted bit sequences** to efficiently debug signal jitter on large quantities of data. The jitter trend graph and histogram create a quick view of the nature and source of signal jitter, simplifying the engineer's work.

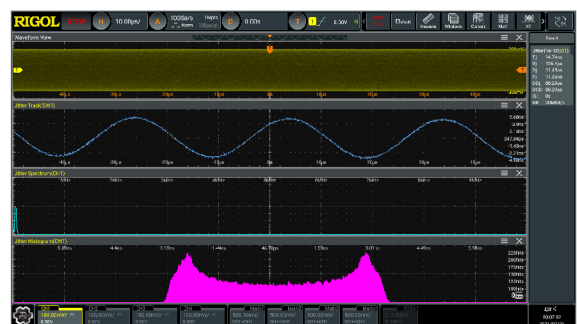

#### Electronic Label

The product model and its main parameters are displayed on the electronic label. The parameters will be updated automatically after upgrade to keep the information displayed on the electronic label consistent with that of the current instrument. The label contents can be sustained up to **20 years even at power-off state**. Users can get the updated product information in a timely manner through the electronic label.

The jitter analysis is mainly used to measure and analyze the clock jitter. The DS70000 series can accomplish the following jitter analysis items. Among the items, TIE is the most commonly used jitter specification.

Perform TIE measurements on the clock signal with the jitter and analyze the results through the trend graph and histogram.

### NOTE:

[1]: 5 GHz bandwidth is only applicable to half-channel mode; 4 GHz for full-channel mode. CH1 and CH2 are considered as a group; CH3 and CH4 are considered as another group. If one of the two channels in each group is enabled, it is called half-channel mode.

[2]: CH1 and CH2 are considered as a group; CH3 and CH4 are considered as another group. If two channels in either one group or four channels are all enabled, it is called full-channel mode.

[3]: Maximum value. Half channel, 5 ns horizontal time base, set a sine wave signal with 1 kpts memory depth, 4 div input amplitude, 10 MHz frequency. Others are default settings.

[4]: 1 mV/div and 2 mV/div are a magnification of 4 mV/div setting. For vertical accuracy calculations, use full scale of 32 mV for 1 mV/div and 2 mV/div sensitivity setting.

[5]: Under 50  $\Omega$  and scale <4 mV, the available bandwidth limits are 20 MHz and 250 MHz.

[6]: For any channel, under the same input impedance with DC-coupled, the Volts/div setting is the same for 100mV/div and 200mV/div.

[7]: Standard configuration.
